Sreyas Sunmesh

(+91) 7987367148 | Bhopal, India | sunmeshesreyas@gmail.com | linkedin.com/in/sreyas-sunmesh | github.com/venti-latte-maker

Summary

Specializing in backend development, mainly in **.NET Development**, **RESTful API Design**, and **MVCs**, with experience in **scikit-learn** and general AI technologies.

Education

B.Tech, Computer Science and Engineering (AI & ML), Vellore Institute of Technology, Bhopal — 2023 – 2027
CGPA: 8.52/10

CBSE Class XII, Sharjah Indian School — 2023 (84.4%)

CBSE Class X, Sharjah Indian School — 2021 (89.2%)

Technical Skills

- **Languages:** C#, Python
- **Backend/Frameworks:** ASP.NET, EF Core,
- **ML/DL**: Scikit-learn, NumPy, Pandas
- **Backend & Infra:** RESTful APIs, Git
- **Auth & Security:** JWT(Json Web Tokens), OAuth2

Projects

MUSE - Movie-song Understanding, Search and Extraction
[GitHub- github.com/venti-latte-maker/Muse] *Jul 2026 – Aug 2026*
C#, Microsoft SQL Server, TMDB, MusicBrainz API, JWT

- Architected a full-stack web application that extracts music from films and auto-compiles it into shareable YouTube playlists, integrating three external APIs (Youtube, TMDB, MusicBrainz) into a single recommendation pipeline.
- Designed the relational database schema and user flow architecture (documented via ERD and flow diagrams) supporting both public playlist discovery and personalized recommendations.
- Implemented secure, token-based authentication (JWT) and environment-based secrets management for API credentials and database connections.

AERIS – AI Environmental Risk & Intelligence System
[GitHub – github.com/nikhil-mohammed/AERIS] *Aug 2026 – Present*
Python, React, SQLAlchemy, scikit-learn/XGBoost, Google Gemini API, OpenAQ/Open-Meteo/NASA FIRMS/GDACS

- Architected a full-stack environmental risk dashboard that ingests real-time data from four external APIs (OpenAQ, Open-Meteo, NASA FIRMS, GDACS) across six hazard modules (AQI, flood, heatwave, wildfire, water quality, UV) into a single unified Risk Engine.
- Trained and deployed scikit-learn/XGBoost forecasting models for AQI, flood, and heatwave risk, normalizing every module's output into a shared risk-score schema enforced by a Pydantic-based data contract.
- Built a Gemini-powered chatbot and disaster-impact classifier that extracts and caches structured event data from GDACS news feeds, cutting redundant LLM calls and conserving API quota.
- Implemented a rate-limited (slowapi) alert engine with automated email notifications via Amazon SES for real-time hazard warnings.

Spotify Dropwdown
[GitHub - github.com/venti-latte-maker/SpotifyUI] *Jun 2026 – Jul 2026*
C#, .NET, SpotifyAPI

- Built a lightweight Windows utility that adds a quick-access Spotify control bar to the taskbar area, solving a real usability gap in the native Spotify desktop UI.
- Designed a minimal, always-accessible overlay UI inspired by iOS-style dropdown notification bars, improving playback control speed for everyday use.

Legal Document Translator
[GitHub- github.com/DhruvChoudhary1/legal-analyzer-app] *Dec 2025 - Jan 2026*
Python, Flask, GeminiAPI, Railway

- Built the Google Gemini AI integration powering the app's document classification and analysis engine, connecting the Flask backend to Gemini for legal document processing.
- Engineered the prompt/response pipeline that translates dense legal jargon into plain-English summaries and structured output (document type, parties, key terms, risk items with severity ratings, recommendations).
- Implemented document-type detection logic covering 18+ legal categories (contracts, NDAs, leases, court orders, etc.) via the Gemini integration.

Research Publications

- Deep Pulse: Exploring Bi-LSTM, GNN and GAN Models for Heart Disease Prediction. DOI

Certifications

- Certificate in Advanced Software Engineering and AI Foundation - MPOnline
- Gen AI using IBM WatsonX - IBM
- Applied Machine Learning in Python (University of Michigan)
